this volume consists of introductory lectures on the topics in the new and rapidly
developing area of toric homotopy theory and its applications to the current
research in configuration spaces and braids as well as to more applicable
mathematics such as fr codes and robot motion planning the book starts
intertwining homotopy theoretical and combinatorial ideas within the remits of
toric topology and illustrates an attempt to classify in a combinatorial way
polytopes known as fullerenes which are important objects in quantum physics
quantum chemistry and nanotechnology toric homotopy theory is then
introduced as a further development of toric topology which describes properties

of davis januszkiewicz spaces moment angle complexes and their generalizations to polyhedral products the book also displays the current research on configuration spaces braids the theory of limits over the category of presentations and the theory of fr codes as an application to robotics the book surveys topological problems relevant to the motion planning problem of robotics and includes new results and constructions which enrich the emerging area of topological robotics the book is at research entry level addressing the core components in homotopy theory and their important applications in the sciences and thus suitable for advanced undergraduate and graduate students
